

Turf Management with Worm Power Liquid Extract and Granular

The use of Worm Power Liquid Extract (WPLE) has shown greater root development and recovery when added to a management program. The combination of both granular and liquid can be utilized to best fit management needs. Worm Power granular vermicompost adds organic matter to the soil as well as an inoculating dose of microorganisms that help make the soil structure favorable for turf growth. The liquid extract provides additional microbes in a form that can penetrate the rhizosphere. These additions to the soil help promote nutrient uptake, soil health, and root growth for the plant.

Tees and greens: Apply Worm Power granular at core aeration at 5 lbs. /1,000 sq ft. followed up at 16 oz WPLE/ 1,000 sq ft. per month during the season or 8 oz WPLE/ 1,000 sq ft. bi-weekly. Split applications have been observed to have greater efficacy on damaged turf.

Turf repairs: Use Worm Power granular in divot mixes, then treat with WPLE. Combine granular at 5-10% by volume with the divot mix. After the patch is repaired, spot spray with 5% WPLE solution to encourage seed germination and growth. The combination of both granular and liquid helps promote root growth and repair.

Pictured below is a comparison of 4.25-inch holes pulled from the turf at the same time. The repair zones measured 2.8 inches in the control and 1.8 inches with Worm Power. The addition of Worm Power helps turf recover approximately 50% faster.
